**Abstract:** Alopecia is considered a common disorder in pediatric age group which differs in clinical presentation from older patients. Alopecias in children can be classified into congenital and acquired causes either originating from hair follicle or hair shaft. It can be also classified as permanent or irreversible due to loss of hair follicle which is known as "cicatricial alopecia" or may be reversible in which hair follicle are preserved and in this case known as " non cicatricial alopecia"  
According to the area affected, pediatric alopecia also can be categorized into patchy, diffuse and patterned in addition to with or without hair shaft fragility. Non cicatricial alopecia can be caused by several disorders such as alopecia areata, tinea capitis, trichotillomania, congenital triangular alopecia, tractional alopecia and pressure induced alopecia, while cicatricial alopecia is caused by lichen planopilaris, discoid lupus erythematosus, CCCA, FFA, Hair loss can be of patchy presentation or diffuse hair loss such as telogen or anagen effluvium. Hair shaft disorders are divided into acquired or congenital conditions characterized by defects in the structure of the hair shaft with or without fragility. Hair is considered an important component for identity and self image of the person.Children with dermatological diseases, including hair loss, usually gain many psychological problems and they have loss self confidence.CDLQI is a simple method for assessment of quality of life in children.  
This work aimed at evaluation both clinical and trichoscopic aspects of hair loss in children in addition to its impact on their quality of life.  
This study was carried on 70 patients with alopecias in childhood period for assesment of personal history,medical history and family history of similar alopecias conditions or other related diseases. Clinical examination as well as trichoscopic examination of each case and applied Children Dermatology Life Quality Index for children aged from 4 to 16 years old. In the present study 70 patients were included (48.6% males and 51.4% females). Their ages ranged from 2-16 years.The duration of their condition ranged from 0.04-15 years. There
